

TV mode taught one of the most important things in photography, which is the shutter speed. It is the speed of the shutter for the camera to close. The more it takes time to close, the more light enters the camera. Therefore, the picture would be affected by that in some visual way. I managed to understand this concept, by taking some pictures of the traffic. Since that the cars are moving, Increasing the shutter speed would get the object in 2 different places, and it would look that the object moved from point 1 to 2 very fast in the picture. Also when you want to take a photo for a waterfall or moving water, you need to understand this concept.
